

## ABSTRACT

The recording of audiovisual contents broadcast according to a schedule includes a step of selecting from an access terminal an audiovisual content to be recorded associated with a broadcast date and time, and a step of the access terminal receiving a record file of the selected audiovisual content. The record file contains information identifying the audiovisual content and the scheduled date and time for broadcasting the content. The recording further includes a step of the access terminal selecting a set of contents having a common topic. The selected set of contents having a common topic is offered by an audiovisual content presentation server, which then selects the audiovisual content automatically on the basis of the set selected. The recording also includes a step of updating the record file, especially in the event of modification of the audiovisual content selected by the presentation server.
